

# Plan Explorer Live Query Profile

Last Modified on 15 July 2021

**Live Query Profiling** allows for the capture and replay of live query execution data. To enable the collection of live query data, select the arrow next to **Get Actual Plan**, and then select **With Live Query Profile**. When this setting is enabled, live query execution data is captured along with the actual plan. **Plan Explorer** adds the benefit of being able to replay a live query. This replay data saves as part of the **Plan Explorer** session file.

## Related Settings

Setting	Description
<b>Default Actual Plan Collection Mode</b>	Allows you to choose between getting only an actual plan or getting the actual plan and live profile by default.
<b>Live Profile Data Collection Interval</b>	Determines how often live query data is collected. The minimum value is 100 ms.

For more information about this feature, see the [Plan Explorer Update Just in "Time" for the New Year](#) blog post.

**Note:** A minimum of SQL Server 2014 SP1 is required to collect live query profile data.
