

Task Factory Error Row Handling

Last Modified on 28 September 2020

Using Error Row Handling

Many components allow for error row handling. These features can be found at the bottom of all Task Factory components that include this functionality.

Note: Some components cannot use the **Not Used** option. This selection is omitted from their error handling options.

Error Row Handling Option	Definition
Not Used	Error handling is not used and no error constraint is available.
Ignore Failure	All errors are ignored and the package continues to execute.
Redirect Row	All errors are directed to an error output.
Fail Component	On error, the component fails execution and stops the package.
