

# Creating a Task Factory Log File

Last Modified on 28 September 2020

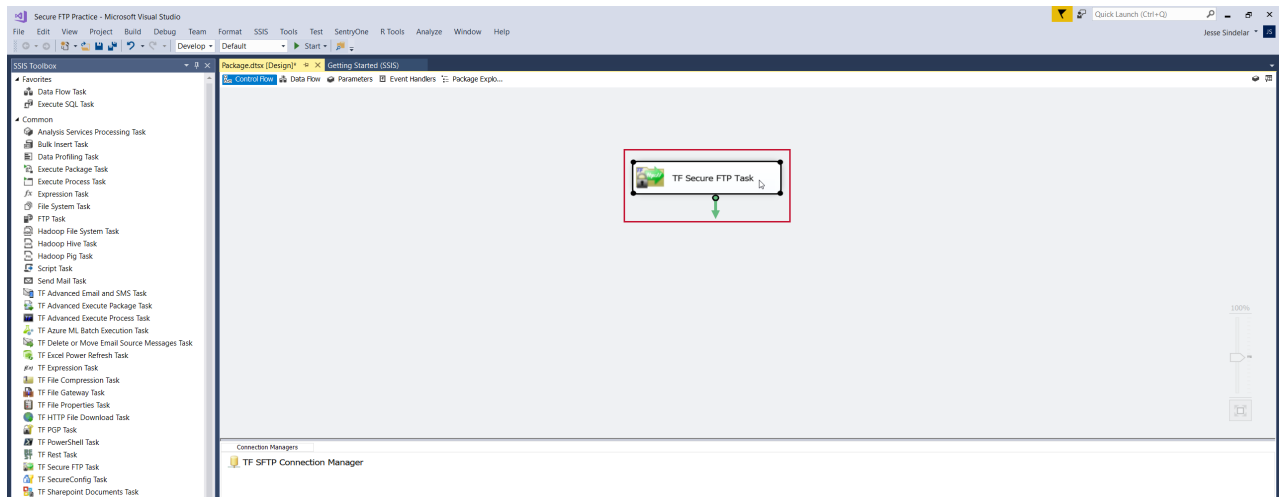

If you are running into any problems or errors with a Task Factory component, you can create a log file to record exactly what is happening. This log file helps you and [support.sentryone.com](https://support.sentryone.com) diagnose any problems and work toward a solution.

To create a log file for your Task Factory component, complete the following steps:

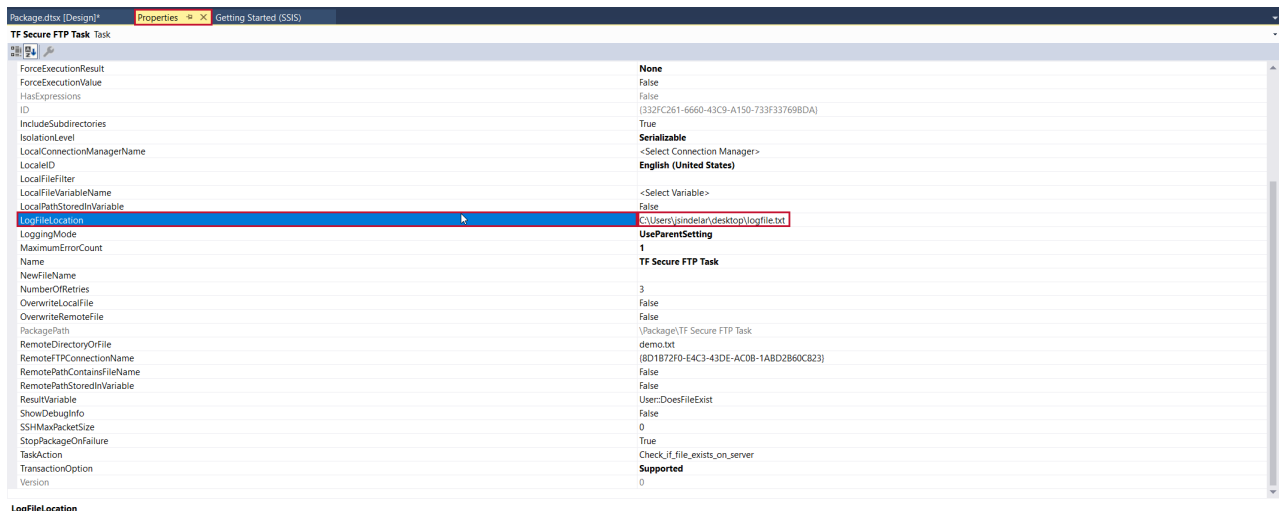

1. Open your Visual Studio package containing the Task Factory component.

2. Select the Task Factory component, then select the **F4** key to open the **properties** window.

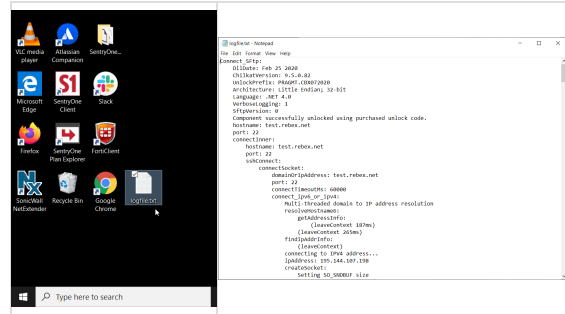

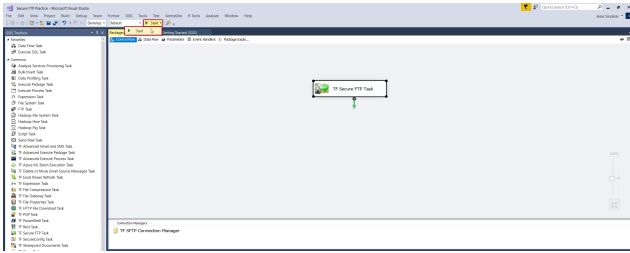

3. Go to the **Misc properties** section, then enter a fully qualified file path and name in the **LogFileLocation** property.

**Note:** The file path and name should take the following example format: **C:\Users\username\Desktop\LogFile.txt**.

4. Save your package and **LogFileLocation** property settings. Execute the package to generate the file in the specified location.

**Success:** Once your log file has been created, reach out to [support.sentryone.com](https://support.sentryone.com) to find a solution!
